

Appendix B

The N -body data structure

Figure B.1: Data structure in NBODY6++.

The data for positions, velocities and masses are organized according to figure B.1. In the beginning of the arrays are the individual binary components, a total of $2 \times \text{NPAIRS}$ stars. At position $\text{IFIRST} = 2 \times \text{NPAIRS} + 1$ is the first single star, and at position $N = \text{NTOT} - \text{NPAIRS}$ is the last single star. At the end of the arrays, between $N+1$ and NTOT are the centers of masses of the regularized binaries.¹

¹Thanks to Patrick Glaschke for pointing this out.
